Safety and Efficacy of Aneurysm Treatment with the WEB

We read with interest the article by Pierot et al[1] regarding the results of the WEBCAST 2 study. We do, however, take issue with the statement that it confirms the "high" efficacy of the device. They reported a complete occlusion rate of 54% and "adequate" occlusion, including neck remnants, in 80% of 50 aneurysms (93% unruptured). The complete occlusion rate from neurosurgical clipping in the largest randomized controlled trials of coiling versus clipping of ruptured aneurysms was 96%.[2,3] A meta-analysis of clipping of unruptured aneurysms showed a complete occlusion rate of 92%.[4] Although the decision to proceed with endovascular therapy in WEBCAST was made by a multidisciplinary team, it may be wise to temper one's enthusiasm for novel endovascular devices when open neurosurgical treatment may offer a truly "high" level of efficacy.
