

Online Figure 1 Visualization of the acquisition of the three principal geometric axes $\mathbf{A}$ in coronal, B in axial and $\mathbf{C}$ in sagittal reformations; A Visualization of the acquisition of take-off angle and length of nerve root.

Online Figure 2 Bland-Altman plots of $\mathbf{A} D R G_{\text {vol }}(e 1)$ vs. DRG $_{\text {vol }}(r)$, B DRG $_{\text {vol }}(\mathrm{e} 2)$ vs. $D R G_{\text {vol }}(r), C^{2} R_{\text {vol }}(e 3)$ vs. $D R G_{\text {vol }}(r), D \operatorname{DRG}_{\text {vol }}(e 4)$ vs. $D R G_{\text {vol }}(r)$; the $x$-value shows the mean of the two volumes and the $y$-value shows the difference between the volumes; the dashed horizontal line shows the bias of the paired difference; the dotted horizontal lines show limits of agreement from - $1.96 \times$ standard deviation to $+1.96 \times$ standard deviation. Abbreviations: $\mathrm{DRG}_{\text {vol }}=$ dorsal-root-ganglion volume; $\mathrm{DRG}_{\text {vol }}(\mathrm{r})=$ real dorsal-root-ganglion volume, determined by mean of voxel-wise segmentation by three raters; e1/e2/e3/e4 = equation $1 / 2 / 3 / 4$; $\operatorname{DRG}_{\text {vol }}(e 1 / \mathrm{e} 2 / \mathrm{e} 3 / \mathrm{e} 4)$ = estimated dorsal-root-ganglion volume by equation e1/e2/e3/e4/

Online Figure 3 Bland-Altman plots of $\mathbf{A} D R G_{\text {vol }}(e 5)$ vs. $\mathrm{DRG}_{\text {vol }}(r), \mathbf{B} \mathrm{DRG}_{\text {vol }}(e 6)$ vs. $D^{2} G_{\text {vol }}(r)$; the $x$-value shows the mean of the two volumes and the $y$-value shows the difference between the two volumes; the dashed horizontal line shows the bias of the paired difference; the dotted horizontal lines show limits of agreement from - $1.96 \times$ standard deviation to $+1.96 \times$ standard deviation. Abbreviations: DRGyol $=$ dorsal-root-ganglion volume; DRGvol $(r)=$ real dorsal-root-ganglion volume, determined by mean of voxel-wise segmentation by three raters; e5/e6 = equation 5/6; DRG vol $(e 5 / e 6)=$ estimated dorsal-root-ganglion volume by equation e5/e6

Online Figure 4 Boxplot of $\mathrm{DRG}_{\mathrm{vol}}(\mathrm{e} 6)$ showing the $\mathrm{DRG}_{\mathrm{vol}}\left[\mathrm{mm}^{3}\right]$ for the different lumbosacral heights L4-S2 of men ( $\mathrm{n}=294$ ). The top of the box represents the $75^{\text {th }}$ percentile, the bottom of the box represents the $25^{\text {th }}$ percentile. The line in the middle represents the $50^{\text {th }}$ percentile (median). The whiskers represent the $5^{\text {th }}$ and $95^{\text {th }}$ percentiles, and values beyond lower and upper bounds represent outliers and extreme values. Significances are marked with asterisks (indicating $\mathrm{p}<.001$ ). Abbreviations: $\mathrm{DRG}_{\mathrm{vol}}(\mathrm{e} 6)=$ estimated dorsal-root-ganglion volume by equation e6; L4 $=4^{\text {th }}$ lumbar level; L5 $=5^{\text {th }}$ lumbar level; S1 $=1^{\text {st }}$ sacral level; S2 = $2^{\text {nd }}$ sacral level

Online Figure 5 Boxplot of $\mathrm{DRG}_{\mathrm{vol}}(\mathrm{e} 6)$ showing the $\mathrm{DRG}_{\mathrm{vol}}\left[\mathrm{mm}^{3}\right]$ for the different lumbosacral heights $\mathrm{L} 4-\mathrm{S} 2$ of women ( $\mathrm{n}=216$ ). The top of the box represents the $75^{\text {th }}$ percentile, the bottom of the box represents the $25^{\text {th }}$ percentile. The line in the middle represents the $50^{\text {th }}$ percentile (median). The whiskers represent the $5^{\text {th }}$ and $95^{\text {th }}$ percentiles, and values beyond lower and upper bounds represent outliers and extreme values. Significances are marked with asterisks (indicating p < .001). Abbreviations: DRGvol (e6) = estimated dorsal-root-ganglion volume by equation e6; L4 $=4^{\text {th }}$ lumbar level; L5 $=5^{\text {th }}$ lumbar level; S1 = $1^{\text {st }}$ sacral level; S2 $=2^{\text {nd }}$ sacral level

Online Figure 6 3D rendered visualization of the DRG as geometrical body that is connected to the adjacent nerve segments. An ellipsoidal 3D object was projected onto the sectional surface of an idealized DRG (gray mesh surface). This ellipsoid tapers at its medial and lateral end. However, real DRG morphology at these ends merges with the adjacent nerve segments over a broader volume area (triangular volume regions not incorporated into ellipsoid object, marked by asterisks and arrows). Neglecting this triangular region by simply applying ellipsoid geometry without offset correction would underestimate true DRG volume.

## Online Table 1

Overview of the length of principal geometric axes and volumes of 96 dorsal root ganglia for ground truth
derivation
